Warehouse Label Printer

Week 7 Practice - Problem 2 (Basic)

Printable is the shared capability. PackageBox and Invoice implement it directly without a common parent; printAll() works with a mixed array.

Java solution

```
interface Printable {
    String printLabel();
}
class PackageBox implements Printable {
    private final String trackingId;
    PackageBox(String trackingId) { this.trackingId = trackingId; }
    public String printLabel() {
        return "Package label: " + trackingId;
    }
}
class Invoice implements Printable {
    private final String invoiceNumber;
    Invoice(String invoiceNumber) { this.invoiceNumber = invoiceNumber; }
    public String printLabel() {
        return "Invoice label: " + invoiceNumber;
    }
}
public class Main {
    static void printAll(Printable[] items) {
        for (Printable item : items) {
            System.out.println(item.printLabel());
        }
    }
    public static void main(String[] args) {
        PackageBox p = new PackageBox("TRK-88");
        Invoice i = new Invoice("INV-42");
        printAll(new Printable[] { p, i });
    }
}
```

Sample output

```
Package label: TRK-88
Invoice label: INV-42
```

Note: The loop depends on Printable, not on the concrete item type.
